

SIDE DOOR ASSEMBLY

Abstract

An electric arc engine welder includes a housing having a cavity therein. An opening is defined by the housing and is connected to the cavity. A track member is mounted to the housing adjacent the opening. The track member defines at least one slot along a longitudinal extent thereof. Two hooks are connected to a door and are received in the at least one slot for removably mounting the door to the housing. The two hooks are spaced apart from one another a first distance. Two notches are defined in the track member and are connected to the at least one slot. The two notches are spaced apart from one another a second distance that is different than a first distance. The notches allow the door to be removed from the housing.
